Continuation of 3. NOTE: Applicant has attempted to cancel those claims that directly recite theory and invited Examiner to strike from the application the explanation of the phenomena upon which the operation of the invention is based - note that this explanation constitutes a large portion of the specification. Additionally, Applicant has submitted new evidence requiring careful review and consideration that Applicant believes to be relevant to 112 first paragraph and 101 rejections that have been maintained. A cursory review of the amendments and accompanying materials reveals that Applicant has not overcome either enablement or novelty issues. Note that all the claims, even those that do not directly recite it, still rely on the theory described by Applicant.

Applicant notes that the original starting material for the experiment was tungsten, and implies that the 4 test samples includes "before and after" elemental constitutions, but it is actually not clear from the analysis printout that the 4 sets of data represent anything more than the elemental constitutions of the tungsten samples after being experimented upon. Accordingly, it is not clear that any element was formed, as opposed to being present in the original tungsten sample in trace amounts. Certain claims made in the Remarks regarding this analysis reveal either a misunderstanding of the issues in contention or unwarranted weighting of facts that appear to support a favorable conclusion, but in fact do not. Applicant should make clear which columns represent control data and which columns represent experimental data if the 4 samples (hardly a number adequate for determining statistical certainty) are even to be considered. It is not at all clear from the results supplied by applicant that any energy whatsoever was produced.

Applicant's conclusion that the "sum total of the Khlopov paper is that if one detects a 1.6 MeV peak, new matter is generated" shows a deep misunderstanding of the reference and the relevant physics involved. The fact that the binding energy of O-helium (NOT normal helium) is 1.6 MeV does not provide theoretical underpinning for the results of Applicant's totally unrelated exper-iments. Khlopov clearly states that when the binding energy of 1.6 MeV is provided (i.e., by adequate temperature), helium can be converted to O-He plus a gamma ray. This has nothing to do with changing a proton into a neutron as is postulated by Applicant and required to justify claims of elemental changes in tungsten. Additionally, it has nothing to do with the production of gravity waves.

Applicant has failed entirely to address Examiner's contention that since "low frequency" is not defined in the claims Jackson et al. meets the claims. Note that it is not necessary for the device of Jackson et al. to actually be normally used with 2Hz signals, but rather that it be capable of producing such low frequencies, such is the case. The fact that Jackson et al. teaches the use of higher frequencies is an example of teaching something different, not teaching away. Moreover, Applicant has not addressed the 102 rejection under Bendall at all.
